

How to Write a Competitive MGB Research Fellowship Application

OVERVIEW OF THE PROCESS

The MGB Research Fellowship Award process is highly competitive. To prepare the best application, it may be helpful to understand that the reviewers consider every part of the application in order to select the top proposals.

Reviewers critically assess the scientific quality of the proposed research plan, the applicant's track record and their trajectory towards independence, and the applicant's environment or lab and the support from their mentor. Below is a summary of the guidance that is provided to the reviewers.

REVIEWERS CONSIDER THESE FACTORS IN RANKING YOUR APPLICATION:

Scientific quality of the proposal

- Is the proposal designed to address an important question and have a significant impact?
- Is the proposal well written and clearly organized?
- Is the proposal innovative, or has the applicant developed a new system to make discoveries?
- Can the work be done in a year?
- Are pitfalls and alternative approaches adequately considered?
- Is the preliminary data convincing?

Trajectory

- Is there an indication that the applicant is on a pathway to independence?
- Do their publications, proposal and the letters indicate that they are formulating their own research ideas?
- Does the applicant have an appropriate number of publications from their graduate and postdoc years? Are the publications important to the field?

Mentorship

- Does the applicant have strong support from their mentor? Is the mentor committed to developing the applicant's independent career?
- Has the mentor successfully trained other fellows?

INCREASING YOUR COMPETITIVENESS

Here are some suggestions to increase the competitiveness of your proposal:

1. General suggestions

- Make sure that you are eligible to apply, based on the information provided in the call for applications.
- Consider whether this is the best time for you to submit a proposal. Only one application per year is allowed, so if you will be in a better position in terms of publications or preliminary data in a few months, it is best to wait.
- Please carefully proofread all sections of your proposal. Prepare well in advance and ask your

mentor to read the entire proposal. If you need help with grammar, please have a colleague read a final proof.

2. Research plan

- Make your proposal understandable to a broad range of scientists. The reviewers are from many MGH departments, but it is rare that more than one will be expert in your area of research. The proposal must be written so that it can be understood by investigators from many research fields. Avoid jargon and overuse of acronyms. A well-constructed figure is good, but don't paste in figures without an explanation of what they show and why the data is important.
- You must convince the reviewers that your research is important. The best research has an irreplaceable influence on a field. Tell us what previous findings underlie your work, what the current gap in knowledge or research capability may be, and how the field will be influenced by what you propose to do.
- Why are you the best person to do the research? How are your skills and background best suited to the proposed work? What is your contribution to the preliminary data?
- Do you understand the scope of the work? Can it be done in a year? How will the work be extended in the future? How will it contribute to your future career goals?

3. Long term career plan

- Briefly describe your career path so far, and how you see your independent career in the future. How will this award help to make that happen? This is a good place to include information about additional funding opportunities you are applying for (K awards etc.) that will support your career development.

4. Biosketch

- Your biosketch should be carefully prepared, listing your previous positions, awards and references in chronological order. The statement section of the biosketch can be used to highlight your unique qualifications for the proposed work or to explain unusual aspects of your career path.

5. Letters

- Your supporting letters are extremely important. They should be informative about you as a developing investigator and as a research colleague, not just about the results of your research.
- You and your mentor should discuss these letters well in advance.
- We are now asking the mentor to describe the training program for each postdoc. This section should explain how the mentor will further the independent career of the postdoc, and how previous postdocs from the lab have moved on in their careers. For further guidance please look at the instructions on the Call for Applications.
- The second letter should be from your graduate advisor unless this is not possible. If this is lacking, the reason should be explained in your personal statement.
